The size of the bovine genome is 3 Gb (3 billion base pairs). It contains approximately 22,000 genes of which 14,000 are common to all mammalian species. Bovines share 80 percent of their genes with humans; cows are less similar to humans than rodents (humans and rodents belong to the clade of Supraprimates).

Genomics has helped develop a test for trichomoniasis (trich) that can detect pathogenic trichomonads and ignore harmless ones that may also be present. Genomic tests have also been developed for bovine genital campylobacteriosis (vibrio). Traditional vibrio tests relied on sample cultures that took much longer.

The BCM-HGSC sequenced and analyzed the bovine genome (*Bos taurus*). The initial bovine genome assembly and analysis and the study of cattle genetic history were published April 24, 2009. Later efforts centered around finishing the Y chromosome. The most recent efforts to improve the genome are using Pacific Biosciences long-read data.
