Heuristic search is a graph search procedure which uses heuristic information from sources outside the graph. But for many known algorithms, the computational complexity depends on the precision of the heuristic estimates, and for lack of global view in the search process the exponential explosion will be encountered when the node evaluation function estimated is not very precise.

In computer science, artificial intelligence, and mathematical optimization, a heuristic (from Greek εὕρισκω "I find, discover") is a technique designed for solving a problem more quickly when classic methods are too slow, or for finding an approximate solution when classic methods fail to find any exact solution. This is achieved by trading optimality, completeness, accuracy, or ...
