Problems In Operations Research Principles and Solutions

In operations research, a team of experts from the different fields first define the problem then represent that problem in the form of a set of mathematical equations. After that, the computer analysis of these mathematical equations is done to find a solution for the problems, and then these solutions are applied to solve managerial and administrative problems.

The British/Europeans refer to "operational research", the Americans to "operations research" - but both are often shortened to just "OR" (which is the term we will use). Another term which is used for this field is "management science" ("MS"). The Americans sometimes combine the terms OR and MS together and say "OR/MS" or "ORMS".

Simplex Method: Example 1. Maximize $z = 3x_1 + 2x_2$. Subject to $-x_1 + 2x_2 \leq 4$ $3x_1 + 2x_2 \leq 14$ $x_1 - x_2 \leq 3$. $x_1, x_2 \geq 0$. Solution. First, convert every inequality constraints in the LPP into an equality constraint, so that the problem can be written in a standard form.

The transportation problem in operational research is concerned with finding the minimum cost of transporting a single commodity from a given number of sources (e.g. factories) to a given number of destinations (e.g. warehouses). These types of problems can be solved by general network methods, but here we use a specific transportation algorithm.
